EXPERIMENT : 1

NAME : DHANUSH V ROLL NO : 240701115

Design Experiment: “Bad Design vs Good Design” Poster
This design experiment focuses on comparing a poorly designed poster with an improved version to understand the importance of visual clarity and user-friendly design. The main objective was to transform a confusing layout into a clean and attractive poster that clearly communicates product details and pricing.

Concept
The concept of this experiment is **design improvement and usability**. The bad design represents common mistakes like clutter, poor alignment, and unclear information. The good design corrects these mistakes using proper layout, spacing, and typography to create a better user experience.

Color Experiment
Simple and minimal colors were used to improve readability:

- Light background – keeps the design clean and easy to view
- Dark text – improves visibility and contrast
- Limited color usage – avoids confusion and maintains focus

This helps the user quickly understand the content without distraction.

Typography Choice
The text style was improved to enhance clarity:

- Simple and readable fonts were used
- Proper font sizes were maintained for headings and content
- Unnecessary font variations were removed

This creates a clean and professional look.

Layout Arrangement
The layout was redesigned for better structure:

- Elements are properly aligned
- Equal spacing is maintained between items
- Content is organized in a logical order

This makes the design visually balanced and easy to understand.

Product Information
The products included are:

- **Gulab Jamun**
- **Mysore Pak**

In the bad design, the information was unclear and messy.
In the good design, product names are clearly displayed with proper formatting.

Price Display
The price was corrected and simplified:

- Bad design: confusing format (e.g., *1KG@500, 1KG@S500*)
- Good design: clear format (*1KG @ 500*)

This improves readability and avoids user confusion.

Comparison Element
The poster clearly shows:

- **Bad Design** – cluttered, confusing, and unstructured
- **Good Design** – clean, organized, and visually appealing

This comparison helps understand the importance of proper design principles.

Conclusion

This experiment demonstrates how good design principles such as **alignment, spacing, typography, and clarity** can significantly improve communication. The final good design is more user-friendly, attractive, and effective compared to the bad design.
