EXPERIMENT:08

NAME:SANJAY .S ROLL NO: 240701468

Experiment: User Flow in a Mobile Shopping App

Aim

To study and validate the step-by-step process of online shopping through a mobile application interface, from browsing products to order confirmation.

Apparatus

- Smartphone with prototype shopping app (wireframe screens)
- Internet connection (assumed)
- User account

Procedure

1. **Step 1 – Product Grid (Observation Stage)**

    - User opens the app and sees a grid of product/category placeholders.
    - Hypothesis: The grid layout helps quick visual browsing.
2. **Step 2 – Category List (Controlled Variable)**
    - User navigates to categories: sportswear, t-shirt, jeans, sweater, shoes, hat.
    - Independent variable: Category chosen.
    - Dependent variable: Products displayed.
3. **Step 3 – Product Options (Testing Samples)**
    - User views four product placeholders within the chosen category.
    - Action: Selects one product for deeper analysis.
4. **Step 4 – Product Detail (Analysis Stage)**
    - Product page shows image, description, and “Buy” button.
    - Observation: User can evaluate product features before purchase.
5. **Step 5 – Checkout Form (Data Collection)**
    - User enters payment method, name, address, phone number.
    - Action: Clicks “Place Order.”
    - Hypothesis: Correct data entry ensures successful transaction.
6. **Step 6 – Order Confirmation (Result Stage)**

    - Screen shows checkmark and “Order placed successfully.”
    - Outcome: Hypothesis confirmed — the app supports a complete purchase cycle.

Observations

- Each screen logically follows the previous one.
- The flow minimizes confusion by guiding the user step by step.
- Essential details (product info, payment, confirmation) are captured at the right stage.

Conclusion

The experiment validates that the wireframe design supports a smooth shopping journey. The user can browse, select, purchase, and confirm an order in six clear steps, demonstrating effective interface design.
