EXPERIMENT:07

NAME:DHANUSH V ROLL NO :240701115

Aim

To study how users interact with different versions of the KK Tea Shop login page and determine whether the design supports smooth authentication.

Apparatus

- Prototype login pages (three variations: blue, pink, textured backgrounds)
- User credentials (email/username + password)
- Internet connection

Procedure

1. **Step 1 – Input Fields (Observation Stage)** ○ User enters email/username and password. ○ Independent variable: Background design (blue, pink, textured). ○ Controlled variable: Same fields and options across all versions.
2. **Step 2 – Options (Testing Variables)** ○ Checkbox: “Remember me.”

○ Links: “Forgot your password?” and “Sign up.”

- Observation: These options provide flexibility for different user needs.

3. **Step 3 – Authentication (Action Stage)** ○ User clicks "LOGIN." ○ Hypothesis: Correct credentials will allow access; incorrect ones will trigger error messages.
4. **Step 4 – Alternative Login (Experiment Extension)** ○ Option: "Continue with Google." ○ Observation: Provides faster login and reduces friction.

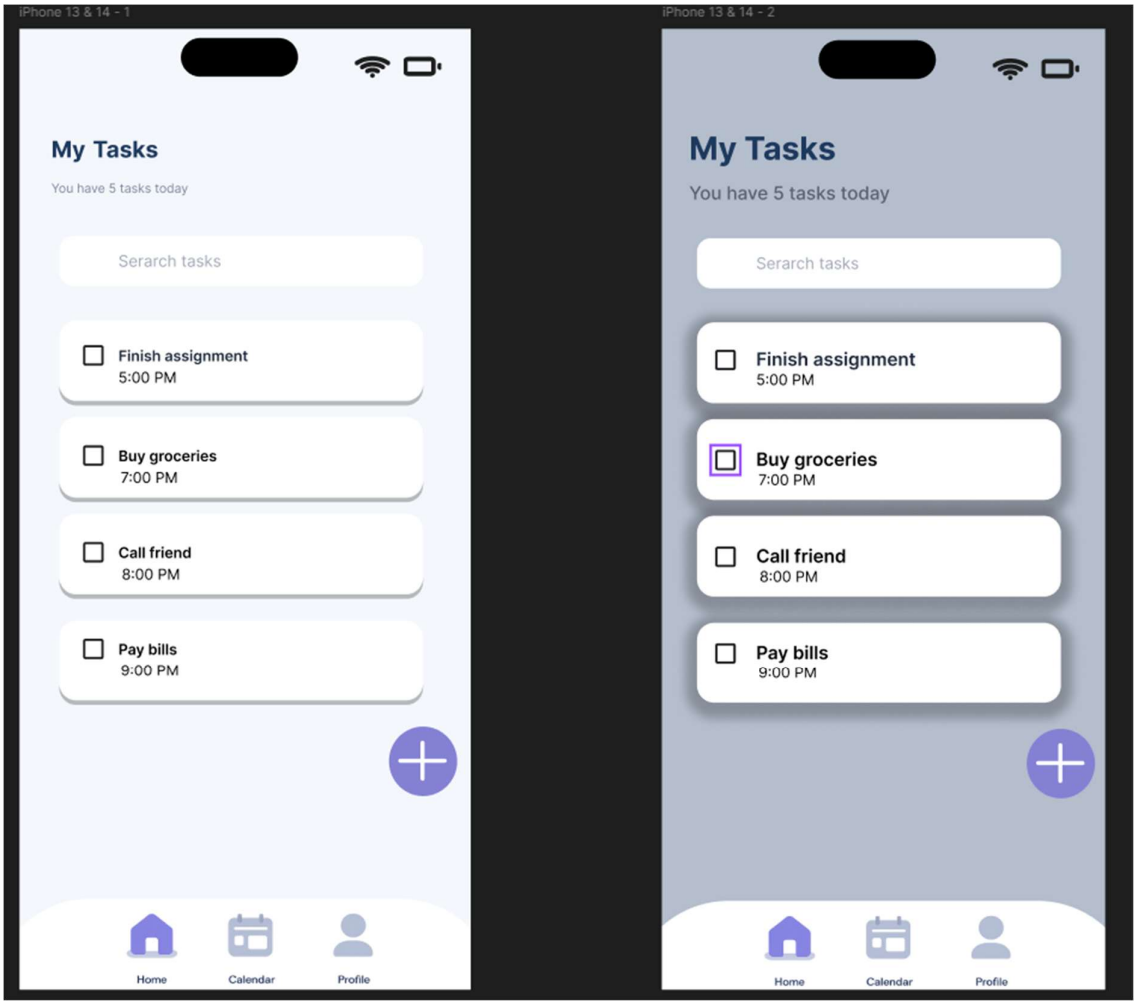
Observations

- All three versions maintain consistent structure (fields, buttons, links).
- Only the background design changes, which may affect user perception but not functionality.
- The "remember me" checkbox ensures convenience for repeat users.
- The "forgot password" and "sign up" links support recovery and onboarding.

Results

- Login process is identical across all versions.
- Background variations do not affect usability but may influence aesthetics and user comfort.

Conclusion

The experiment confirms that the KK Tea Shop login interface is functionally consistent across design variations. The


essential elements (fields, login button, recovery options, alternative login) ensure a reliable authentication process, while background changes serve as design trials to test user preference.
