EXPERIMENT : 02

NAME : Dhanush V ROLL NO : 240701115

Experiment: Visual Memory Recall Test

Aim:

To evaluate the participant's ability to observe, remember, and recall visual icons.

Objective:

The experiment measures short-term visual memory by asking participants to observe a set of icons and later identify them from a recall screen.

Procedure:

1. The participant first reads the instructions displayed on the screen carefully.
2. A set of icons is shown to the participant for a limited period of time.
3. The participant must observe the icons closely and try to remember them.
4. After the observation phase, a recall screen appears containing multiple icons.
5. The participant selects the icons that were previously displayed.
6. Once the selection is completed, the system evaluates the responses.
7. The participant's score is then displayed based on the number of correct selections.

Result / Outcome:
The score reflects the participant's **visual memory and recall ability**. Higher scores indicate better short-term visual memory performance.
Conclusion:
This experiment helps analyze how effectively a person can **encode, store, and retrieve visual information** within a short period.
